

WEBSITE DEVELOPMENT PROPOSAL | CONFIDENTIAL

RAEN

E-Commerce Website Build

A complete, launch-ready luxury fashion e-commerce store covering every essential for trading internationally and running the brand independently.

2

PHASES

1 Week

TIMELINE

Rs. 1,00,000

INVESTMENT

Project Overview

RAEN is a luxury fashion label with a strong brand identity, a defined product range of 12 pieces, and real ambition to trade internationally. The backend infrastructure - the database, payment integrations, security layer, and email system - has already been built by the previous development team and is fully functional. What remains is completing the customer-facing experience, the management tools, and the brand presentation to a standard that matches the product's price point and RAEN's positioning.

This proposal covers exactly what you have asked for, and explains clearly why each component is necessary - not as a luxury, but as a minimum requirement for the business to operate, for customers to trust the brand, and for any paid advertising to generate a profitable return.

What Has Already Been Built

The previous development team completed the backend foundation of the store. This is significant work and it is fully functional. This proposal builds on top of it - not starting from scratch.

Complete backend API

Over 60 API routes covering products, cart, checkout, orders, payments, customer accounts, admin, newsletter, early access, and contact. All tested and operational.

PostgreSQL database

A 13-table relational database fully configured with all 12 RAEN products, sizes, and starting inventory seeded and ready.

Payment gateway integrations

Razorpay, PayPal, and manual UPI are all integrated at the service layer. The connection logic exists - the final step of confirming payments is what this proposal completes.

Security infrastructure

JWT authentication, bcrypt password hashing, rate limiting, CORS, and security headers are all implemented and protecting the backend.

Email templates

Seven email templates are fully coded and ready to send: order confirmation, payment update, newsletter welcome, early access confirmation, contact acknowledgement, and more. They need only SMTP credentials to activate.

Core shopping pages

The collections listing, product detail pages, shopping bag, and checkout are all built and connected to the backend. Customers can browse and initiate a purchase today.

Everything above is complete. This proposal covers the remaining work to make it launch-ready.

Your Requirements - Fully Addressed

You have defined a clear, focused scope: clean luxury frontend, responsive design, working checkout, Razorpay, PayPal, admin dashboard, and email confirmations. Every item in this proposal directly serves one or more of those requirements. Nothing here is padding.

Clean luxury frontend

Phase 2, Item 3

The landing page redesign delivers this. Every scroll, transition, and typographic choice is benchmarked against brands like Roberto Cavalli, Bottega Veneta, and The Row.

Responsive design

Throughout

Every page built in this proposal is tested on iPhone, Android, and desktop before sign-off. Mobile is treated as equal priority to desktop.

Working checkout

Phases 1 + 2

Checkout exists. For it to actually work end-to-end, it requires working payment webhooks (so orders confirm), database transactions (so data is reliable), and customer accounts (so buyers can track what they paid for). All three are in Phase 1.

Razorpay + PayPal

Phase 1, Item 2

Both are integrated at the service layer. The final step - confirming the payment back to the store when money lands - is what the webhook implementation completes.

Admin dashboard

Phase 1, Item 5

Orders, inventory, payment approvals, customer list - exactly what you specified. Built securely on top of a verified admin auth layer.

Email confirmations

Phase 1, Item 2

The templates are coded and ready. They trigger automatically when the payment webhook fires. Without the webhook, no email is ever sent even though the code exists.

Phase 1 - Complete Commerce Foundation

8 deliverables covering every mandatory trading requirement

Rs. 65,000

Every item below is a hard requirement for the store to function. None of them are optional features or improvements. Each one is either broken right now, missing entirely, or a prerequisite for something else that you have already said you need.

1

Fix Broken Product Links

CRITICAL FIX

WHAT IS BEING BUILT

Update all homepage and collections page links that currently point to old standalone HTML product pages. Redirect them through the unified product detail system. Remove the 12 orphaned static pages.

WHY IT IS MANDATORY

Your homepage is the first thing a potential buyer sees. Right now, clicking a featured product on the homepage takes the customer to a broken page with no cart, no checkout, and no way to purchase. The site is live but effectively non-transactional from the homepage.

WITHOUT THIS

Every customer who arrives from social media, a shared link, or an ad and clicks a featured product encounters an error. They leave. You lose the sale and the customer's trust in the same moment.

IMPACT ON SALES & ADS

Meta ads drive traffic to your homepage and product pages. If those links are broken, every rupee spent on ads sends customers to a dead end. Your ad spend is wasted until this is fixed.

2

Payment Confirmation System (Webhooks)

CRITICAL INFRASTRUCTURE

WHAT IS BEING BUILT

When a customer pays via Razorpay or PayPal, those providers send a real-time confirmation to the store. Currently the signal is received and discarded - the backend does nothing with it. This implementation makes the store verify the payment, mark the order as paid, reduce inventory, and automatically send the customer their confirmation email.

WHY IT IS MANDATORY

You have specifically asked for working Razorpay, PayPal, and email confirmations. None of those work correctly without this. The payment integrations exist. The email templates exist. This is the single connection that makes both of them function.

WITHOUT THIS

A customer pays successfully, sees a payment success screen on Razorpay, and waits for a confirmation email that never arrives. The order sits as Pending in your database. Your admin dashboard shows nothing to ship. The customer contacts you. You have no record of their payment.

IMPACT ON SALES & ADS

Ads that drive purchases are only profitable if those purchases complete cleanly. Without webhooks, your conversion data is unreliable - Meta cannot optimise your campaigns because it cannot confirm which ad led to a completed sale.

3

Payment Data Integrity

INFRASTRUCTURE SAFETY

WHAT IS BEING BUILT

Wraps the payment confirmation process in a single database transaction. All three database updates - mark payment paid, update order status, reduce inventory - either succeed together or none apply. The 200 confirmation is only sent to Razorpay or PayPal after all three are committed.

WHY IT IS MANDATORY

Financial data must be reliable at every point. This is a non-negotiable requirement for any commerce system that handles real money. It also ensures your inventory counts are always accurate, which is essential for the admin dashboard you have requested.

WITHOUT THIS

A server interruption mid-payment means the customer is charged but the order is not created, or the order is created but inventory is not reduced - resulting in overselling, manual reconciliation, and potential customer refund disputes.

4

Contact Form Integration

CUSTOMER TRUST

WHAT IS BEING BUILT

Connect the contact page form to the backend. Customer messages are stored in the database and accessible via the admin dashboard. The form shows a confirmation to the customer when submitted.

WHY IT IS MANDATORY

A luxury brand at EUR 1,450 per piece must be reachable. Customers purchasing at this price point expect to be able to ask questions before buying. The contact page exists and is styled. Currently every submission disappears.

WITHOUT THIS

Customers who cannot reach you before purchasing do not purchase. Customers who submit a query and receive no response tell others. At this price point, lost trust is very difficult to recover.

5

Admin Security Verification + Dashboard Build

YOUR REQUIREMENT

WHAT IS BEING BUILT

Verify the admin authorisation layer in the database before building the dashboard interface. Then build the full admin panel with: live orders list with status management, inventory levels per product and size, UPI payment approval queue, and customer list with order history - exactly as you specified.

WHY IT IS MANDATORY

You cannot run a fashion business without being able to see your orders, know what is in stock, and manage payments. Right now none of these are visible without direct database access. The backend API for all of these is complete - this builds the interface on top of it.

WITHOUT THIS

Every order is invisible. You cannot see what to dispatch, what stock is running low, or which UPI payments need approval without a developer opening a database tool. The business cannot operate independently.

IMPACT ON SALES & ADS

Without order visibility, you cannot confirm dispatch times to customers, which directly affects review scores and repeat purchase rate - both of which influence ad campaign profitability over time.

6

Customer Login and Registration

RETENTION SYSTEM

WHAT IS BEING BUILT

A clean login and register interface accessible from the navigation on every page. Session persists across visits so customers stay logged in. Matches the RAEN design language and works on all devices.

WHY IT IS MANDATORY

International customers buying at EUR 1,450 want to be able to track their order, refer back to past purchases, and manage their details. Without accounts, you have one-time buyers with no mechanism for building a relationship with the brand.

WITHOUT THIS

Guest checkout means every customer is a stranger. No order history, no saved addresses, no way to re-engage them without starting from scratch on every acquisition.

IMPACT ON SALES & ADS

Meta ads are significantly more profitable when retargeting existing customers. Customers with accounts can be retargeted with purchase history data. Without accounts, every sale costs the same as the first sale - your CAC (customer acquisition cost) never improves.

7

Customer Account and Order History Page

RETENTION SYSTEM

WHAT IS BEING BUILT

A dedicated account area where logged-in customers can view all their orders with current status, track dispatch, and manage saved delivery addresses. Connects to backend account APIs that are already built.

WHY IT IS MANDATORY

This is what makes customer accounts useful. Without an order history page, creating an account provides no benefit to the customer and they will not bother. The feature only works if both sides exist.

WITHOUT THIS

Customers cannot self-serve their order queries. Every status check becomes a direct message or email to you. At 20+ orders per month, this becomes a full-time customer service task.

8

Order Cancellation and Refund System

LEGAL REQUIREMENT

WHAT IS BEING BUILT

A backend cancellation flow that calls the Razorpay or PayPal refund API, updates the order to Cancelled, restores inventory, and sends the customer a cancellation confirmation. A cancel button in the admin dashboard triggers this flow.

WHY IT IS MANDATORY

Without a refund mechanism, you have no legal or practical way to return money to a customer through the payment gateway. Consumer protection law in the EU, UK, and UAE - your primary target markets - requires a clear and functional refund process.

WITHOUT THIS

You refund manually by logging into Razorpay or PayPal, then manually update the database, then manually email the customer. A single refund takes 30 minutes of admin time and is prone to errors.

Phase 2 - Brand Experience

2 deliverables that directly determine conversion rate

Rs. 35,000

Phase 2 addresses the two items that determine whether a visitor who arrives at RAEN - from Instagram, an ad, or a shared link - decides to buy or not. Both are directly tied to revenue.

9

Product Page SEO and Social Sharing

TRAFFIC & DISCOVERY

WHAT IS BEING BUILT

When a product link is shared on Instagram, WhatsApp, or any platform, the platform reads Open Graph meta tags to generate a preview card showing the product image, name, and price. Currently product pages are rendered by JavaScript, so these tags are empty when any crawler reads them. This injects the correct data so every share shows a real product preview instantly.

WHY IT IS MANDATORY

Every time RAEN or a customer shares a product link, the preview is blank. No image, no product name, no price. This looks broken and unprofessional. It also means Google cannot read and index RAEN product pages, so the brand has no organic search presence.

WITHOUT THIS

Every shared product link - whether by you, a customer, or an influencer - generates zero visual impact. Social sharing is effectively dead as a discovery channel.

IMPACT ON SALES & ADS

Meta ads work by driving traffic, but organic sharing multiplies that traffic for free. When a customer shares a RAEN link and it generates a beautiful product card, that is free reach. Without meta tags, that multiplication does not happen. Every sale costs more because you cannot benefit from word of mouth at scale.

10

Landing Page Luxury Redesign

CONVERSION REQUIREMENT

WHAT IS BEING BUILT

A full redesign of the RAEN homepage to the visual standard of a luxury fashion house. Full-viewport editorial imagery, cinematic scroll behaviour, refined typography, and product presentation consistent with brands like Roberto Cavalli, Bottega Veneta, and The Row. Fully responsive for mobile and desktop.

WHY IT IS MANDATORY

You have asked for a clean luxury frontend. This is that. The current homepage is structurally sound but visually generic. A dress priced at EUR 1,450 on a template-looking website creates an immediate trust gap. Visitors do not buy when the presentation does not match the price.

WITHOUT THIS

The single largest driver of abandoned sessions for a luxury brand is visual mismatch - when the product's price does not match the website's quality. Customers assume the brand is untrustworthy or the product is not genuinely luxury.

IMPACT ON SALES & ADS

Meta ads and influencer activity drive visitors to the homepage. If the homepage does not instantly communicate luxury and authority, those visitors leave within 8 seconds. A well-designed luxury homepage converts 2-4x better than a generic one at this price point. Every rupee spent on ads performs better when the landing experience matches the brand promise.

Why This Website Determines Your Ad ROI

This section is the most important one for understanding why this investment pays for itself. Every component above connects directly to the profitability of any advertising the brand runs.

- 1

Broken links waste every rupee spent on ads

Meta ads drive traffic to your homepage and product pages. If those pages link to broken endpoints, ad traffic is sent to a dead end. You pay per click. Every broken click is money gone with no return.
- 2

Unconfirmed payments make conversion data unreliable

Meta's algorithm optimises your campaigns based on confirmed purchases. Without webhooks, purchases are not confirmed in your backend, which means they cannot be reported back to Meta as conversions. The algorithm cannot learn who your real buyers are. Your CPL stays high permanently.
- 3

No customer accounts means your CAC never improves

The most profitable advertising strategy is retargeting existing customers - people who have already bought from you cost 5-7x less to convert again than acquiring a new customer. Without accounts, you have no existing customer base to retarget. Every sale costs the same as the first one.
- 4

Blank link previews kill organic amplification

When a customer receives their RAEN dress and posts about it, they will share the link. If that link shows a blank preview, no one clicks it. Organic sharing is free reach - it multiplies the impact of paid advertising without any additional spend. Meta tags make this work.
- 5

A generic homepage destroys landing page quality score

Meta measures Landing Page Quality as part of ad delivery. A low-quality landing page increases your cost per click and reduces your ad reach. A luxury homepage that matches the ad creative lowers CPL and increases return on ad spend directly.
- 6

Without a refund system, international buyers will not trust the store

UAE, UK, and European customers expect a clear, simple refund process before committing to a EUR 1,450 purchase from a brand they have not bought from before. If no refund mechanism is visible, they do not convert - regardless of how good the ad was.

Investment Summary

PHASE 1 - Complete Commerce Foundation		
Deliverable	Category	Investment
Fix broken product links	Critical Fix	Included
Payment webhooks + confirmation	Infrastructure	Included
Payment data integrity	Infrastructure	Included
Contact form connection	Customer Trust	Included
Admin auth + full dashboard	Your Requirement	Included
Customer login + registration	Retention	Included
Customer account + order history	Retention	Included
Order cancellation + refund system	Legal	Included
Phase 1 Total	Rs. 65,000	

PHASE 2 - Brand Experience		
Deliverable	Category	Investment
Product SEO + social sharing tags	Traffic	Included
Landing page luxury redesign	Conversion	Included
Phase 2 Total	Rs. 35,000	

TOTAL PROJECT INVESTMENT (10 Deliverables, 1 Week)	Rs. 1,00,000
--	--------------

PAYMENT TERMS

50% on project start	Rs. 50,000	Work begins immediately upon receipt
50% on handover	Rs. 50,000	Paid when site is live and tested

WHAT TO EXPECT - DELIVERY IN 1 WEEK

Days 1 - 2	All broken links fixed, payment webhooks live with database transactions, contact form connected, admin authorization
Days 3 - 4	Customer login and registration live, account and order history page, full admin dashboard operational with orders, invoice
Days 5 - 6	Order cancellation and refund flow built, product SEO and social sharing meta tags implemented, luxury homepage red
Day 7	Full end-to-end testing: a real test purchase is placed, payment confirmed, email received, order visible in admin. Mobil

RAEN has the foundation. This proposal completes it.

The backend, the payment integrations, the email system, and the core shopping experience are all already built and waiting. This proposal is not starting from scratch - it is the final stretch from a functional system to a fully operational luxury business that can take real orders from real international customers, manage them independently, and support profitable advertising from day one.

The investment of Rs. 1,00,000 is for 10 specific, necessary deliverables built in 7 days. Every one of them is either something you specifically asked for, or a technical requirement that makes what you asked for actually work correctly. There is nothing in this proposal that is not essential.
